

ABSTRACT OF THE DISCLOSURE

A safety cover for burner dials of a stove is an apparatus that covers front-mounted control knobs or dials on stoves. The safety cover takes the shape of an elongated compartment that spans the width of the stove. The compartment is hinged along the bottom and connects to a square frame that is attached to the stove face via double sided foam adhesive tape or other appropriate adhesive means. When the safety cover is closed, it covers all front-mounted control knobs at once and is secured in the closed position at its top by one or two friction fit snap mounts. An adult user can simply release the snaps and open it in a downward manner to allow for easy and complete access to all knobs.
